

TMF Landscape Design Announces Comprehensive Native Plant Integration Service

September 10, 2026

September 10, 2026 -

TMF Landscape Design, founded by Thomas M. Freeland, has announced the launch of a new service centered on integrating native plants into residential and commercial landscape projects. The initiative reflects growing interest in environmentally responsible landscaping practices and responds to increasing demand for outdoor designs that support local ecosystems while maintaining functional and attractive properties.

The new service from TMF Landscape Design focuses on selecting plant species that are naturally suited to the climate, soil, and environmental conditions of the region. As a landscape designer in Bethpage, NY, the company is emphasizing the role native plants can play in reducing resource requirements while contributing to healthier outdoor environments. Native species are generally better adapted to local conditions, which can reduce the need for supplemental watering, fertilizers, and pesticides when compared with plants that are not suited to the area.

According to a company spokesperson, many property owners remain unfamiliar with the environmental advantages associated with native plant selections. TMF Landscape Design is addressing this information

gap through consultations designed to help clients understand how different species can contribute to pollinator habitats, soil health, and biodiversity. The company is also providing guidance on combining native perennials, trees, and shrubs to create landscapes that retain visual interest throughout the year.

The initiative comes as sustainability continues to influence developments across the landscaping industry. Homeowners, developers, and property managers are increasingly considering how landscaping choices affect water use, maintenance requirements, and surrounding ecosystems. Native plant integration has emerged as one approach that can connect landscape planning with broader environmental goals without eliminating the aesthetic considerations that remain important to property owners.

Thomas M. Freeland and his team have spent more than a decade working on outdoor design projects in the Bethpage area. The company's latest service builds on that experience by placing greater emphasis on plant selection and ecological considerations during the design process. Rather than treating native plants as an occasional feature, TMF Landscape Design is incorporating them as a central element in certain landscape plans based on the needs and characteristics of each property.

In addition to its consultation services, TMF Landscape Design has introduced an online educational resource focused on native plants and their potential applications in local landscape projects. The resource provides information about plant characteristics, environmental benefits, and considerations for incorporating different species into outdoor spaces. The company said the platform is intended to give property owners greater access to practical information before beginning a landscaping project.

The launch also highlights the increasing role of education in sustainable landscape planning. Understanding how plants interact with local soil, weather conditions, insects, and wildlife can help property owners make decisions that extend beyond appearance alone. For communities such as Bethpage, these choices can collectively influence habitat availability and resource consumption across developed areas.

As interest in environmentally conscious property improvements continues, TMF Landscape Design's new offering provides another option for residents and property stakeholders evaluating landscape projects. As a landscape designer in Bethpage, NY, the firm is positioning native plant integration as a way to connect landscape aesthetics with long-term environmental considerations.

Property owners seeking additional information about the service can visit TMF Landscape Design's website or contact the company directly. The initiative represents the firm's continued focus on incorporating

sustainable practices into landscape planning while helping local property owners better understand the relationship between plant selection, outdoor design, and ecological stewardship.
